

Circular Volume 101-150

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1909 Excerpt: ...of known variables found is to the total number found, as the number already known is to the whole number existing in the region, it follows that there are probably 73 variable stars in this region, of which only 41, or about 0.56 have so far been discovered. It is evident that an examination of additional plates of this region would be profitable. The successive columns of Table I give the designation, the Harvard number, the constellation, the number in the Bonn Durchmusterung, the right ascension for 1900, the declination for 1900, the brightest observed photographic magnitude, the faintest observed photographic magnitude, the range, and the class to which the variable belongs. The facts which have so far been collected relating to these stars are given in the Remarks following Table I. The variability of all these objects has been confirmed either by a second observer, or by examination of a sufficient number of photographs to establish the variability beyond question. Several stars were suspected of variability and showed an apparent change of about 0.5 magnitude on the photographs. They are not included in the following list, however, but have been reserved until further evidence of real variability can be secured. REMi 012746. This star has been observed on 50 photographs, taken between November 2, 1892 and February 15, 1907. These observations are satisfactorily represented by the formula for times of maximum, J. D. 2412486 + 337 E. The range of variation is probably greater than that indicated by the photographic magnitudes given in the table. Miss Cannon looked for this object with the 6-inch Equatorial of this

Observatory, on March 6, 1907 and April 2, 1907. On the first date, the star was barely glimpsed in a clear sky, and estimated as about magn...
